

6a Editing real time start times

The PC used to initialize the Actiheart, time stamps the data, so it is important to make sure that time is correct. However, things may go wrong when we travel between time zones!

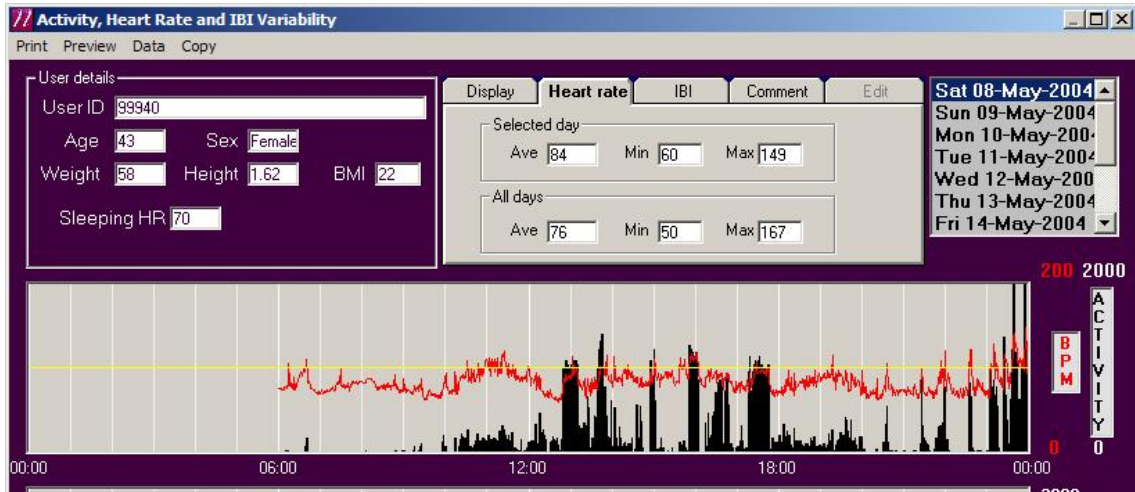

If you know that the computer used to initialize the monitor(s) was on the wrong time zone or displaying the wrong date, you need to time shift the data to ensure the data is put to the correct "real time".

- Open the database through Access.
- Manually edit the time in the starttime column to what the "real time" start time should be (date or time).

Manually edit the start time to what the "real time" was

ReadNo	ComputerName	ComputerUser	ReadTime	Starttime	SerialNo	BatVolts	Calfactor	UserID	TestType

- To verify that this change has correctly occurred, you can view the file through the commercial software and the trace will have shifted x number of hours (see example below)

Here a two hour shift has been applied by changing the start time from 06:00 to 08:00.

Note: It is not necessary to change the ReadTime column as this is only used to check integrity of data on download.
