

Global data for diabetes and obesity research

New ways to collaborate – federated analysis

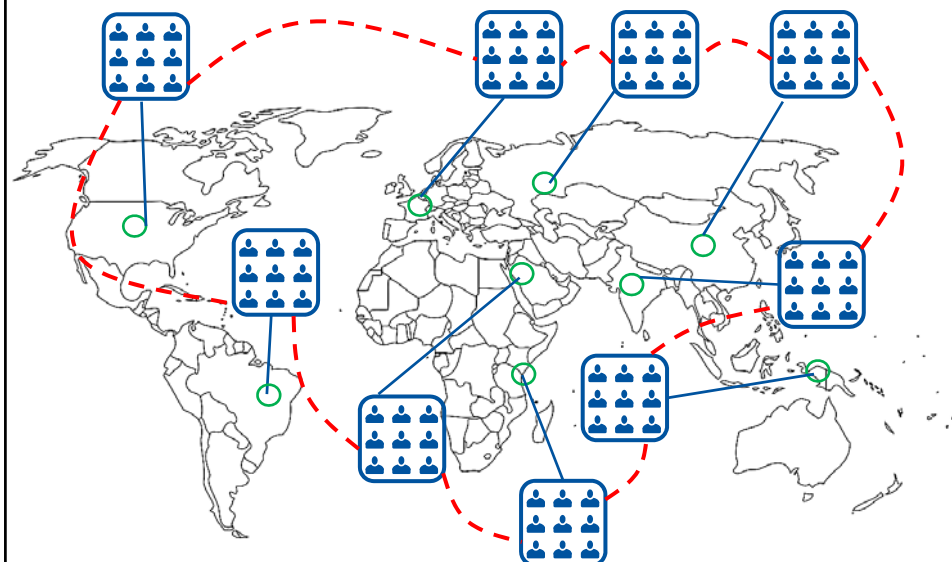

*Tom Bishop
Senior Data Scientist
MRC Epidemiology Unit, University of Cambridge*

This project is funded by the European Union's Seventh Framework Programme for research, technological development and demonstration under grant agreement no 602068.

Overview

- What is InterConnect and federated analysis?
- A real example, focus on harmonisation
- Review of current situation and what we are doing next

InterConnect offers a different way to run analyses over multiple studies

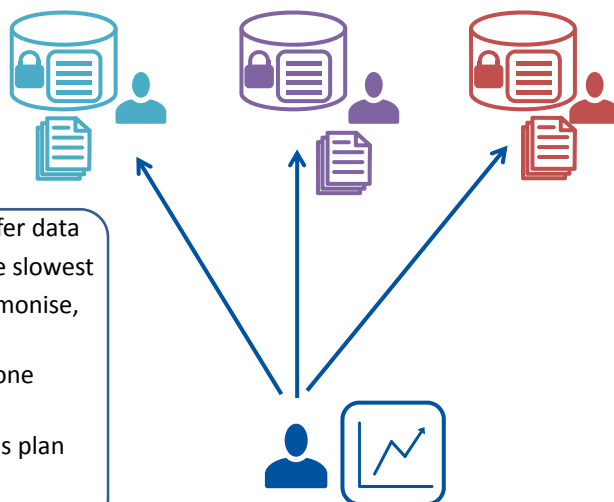

Meta analysis of published results – minimal/no harmonisation

	Review published papers
	Extract relevant results
	Perform overall analysis

- Widely used - simple
- Can only analyse published results – potential bias
- Uncertainty in how the results were derived – inconsistencies between papers
- Results available are fixed

Results sharing

- Useful if unable to transfer data
- Moves at the pace of the slowest
- Takes a long time to harmonise, run and re-run analyses
- Each group needs someone available to do work
- Harmonisation & analysis plan are open to different interpretations

Data sharing

- Potential ethico-legal and governance problems due to moving data around
- Reluctance of data custodians to lose control of data
- Flexible and desirable from an analytical standpoint

InterConnect addresses the challenges by taking the analysis to the data (federated analysis)

- Data stays on each study's server – **no data transfer agreement**
- Analytical commands passed to each server
- Summary results passed back – **no access to individual values**
- No waiting for others to run analysis
- No publication bias

Effect of maternal Physical Activity during pregnancy on Neonatal Anthropometric Outcomes

Your guide to staying active in pregnancy

- ✔ Physical activity in pregnancy is safe and healthy
- ✔ Being active benefits you and your baby
- ✔ Stay active: 30 minutes a day, 4 times a week

Exercising increases the blood flow to the placenta. This is great for your baby's growth and development.

4.5 times 
 ...more likely to have a caesarean section if not active during pregnancy

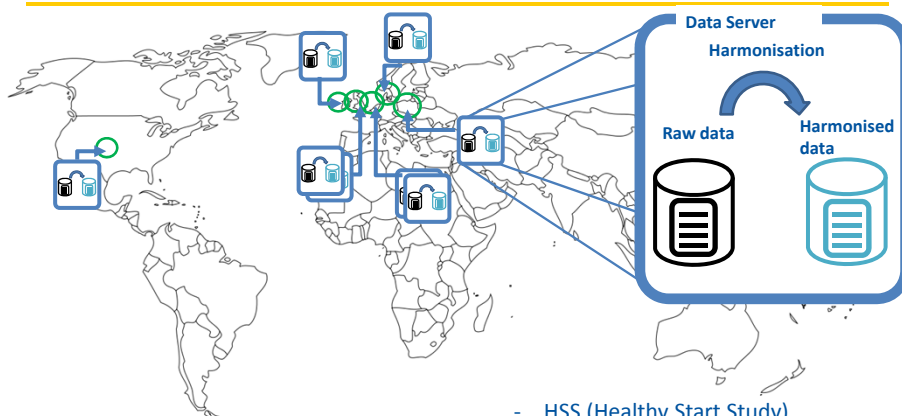

Activity ideas

Always chat with your instructor or midwife to make sure activities work for you

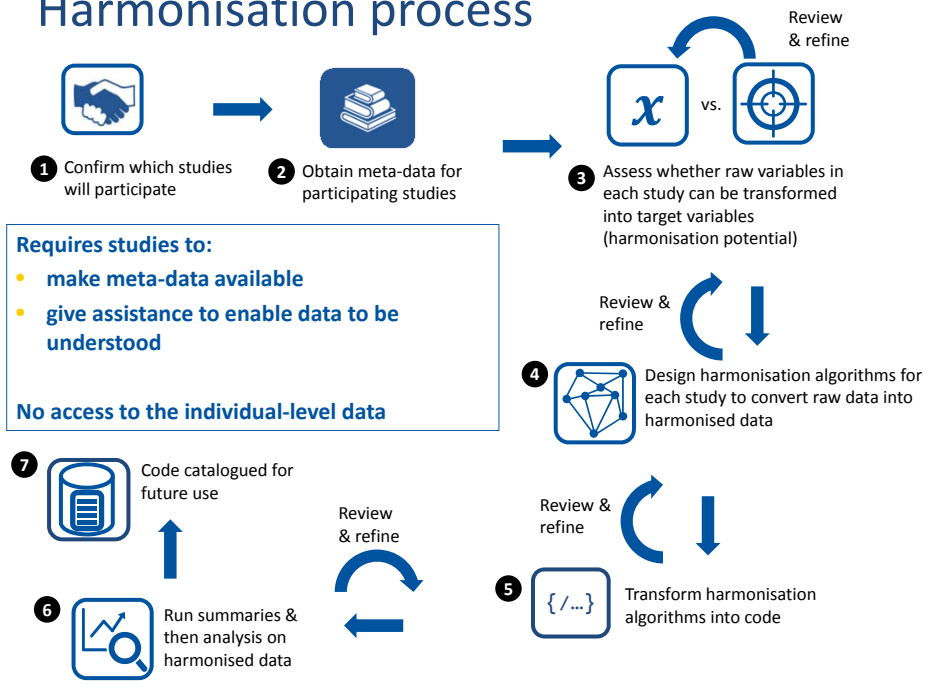

Source www.tommys.org

8 participating studies set up a server & prepared data

- ABCD (Amsterdam Born Children Development)
- ALSPAC (Avon Longitudinal Study of Parents and Children)
- DNBC (Danish National Birth Cohort)
- GECKO Drenthe Study
- HSS (Healthy Start Study)
- REPRO (Polish Mother and Child Cohort Study)
- ROLO (RCT Of LOW glycaemic index diet)
- SWS (Southampton Women's Study)

Harmonisation process

Harmonisation example: Duration of moderate-vigorous leisure time physical activity

ALSPAC:

Question in questionnaire	Q1. HOW MUCH do you do the following at present? <ul style="list-style-type: none"> • Jogging • Aerobic • Antenatal exercises • Keep fit exercises • Yoga • Squash • Tennis/badminton • Swimming • Brisk walking • Weight training • Cycling • Other exercises
Frequency/duration	>7h/w, 2-6h/w, <1h/w, Never h/w = hours/week
Harmonised variable	Duration of moderate/vigorous LTPA (h/w)
Harmonisation rule	1. Convert: >7h/w to 7h/w 2-6h/w to 4h/w <1h/w to 0.5h/w Never to 0h/w 2. Sum up hours/w for all activities over 3 MET* (i.e. exclude antenatal exercises)
Missing data rule	Count single missing activity durations as 0 duration. If all activity durations missing, then mark participant as missing.

*MET = Metabolic Equivalent of Task

Example code for ALSPAC

```

var LTPA_dur = ['b050', 'b051', 'b052', 'b053', 'b054', 'b055', 'b056', 'b057', 'b058', 'b059', 'b060', 'b061'];
var i;
var LTPA_dur_val = newValue(0, 'decimal');

var val_to_add = newValue(0, 'decimal');
var LTPA_sum = newValue(0, 'decimal');
var LTPA_miss = newValue(0, 'integer');

//no imputation - missing values counted as 0
// if they have a -7 for every answer, they didn't do the questionnaire so count as missing
// if they have -1s then they did the questionnaire but didnt fill anything in - assume no activity

for (i = 0; i < LTPA_dur.length; i++) {
  LTPA_dur_val = $(LTPA_dur[i]).map({
    '1': '7',
    '2': '4',
    '3': '0.5',
    '4': '0',
    '9': '0',
    '-1': '0',
    '-9999': '-1',
    '-7': '-7'
  });
  null;
  null;
  if(LTPA_dur_val != -7 || LTPA_dur_val != -1 || LTPA_dur_val.isnull().value){
    val_to_add = Number(LTPA_dur_val);
    LTPA_sum = LTPA_sum + val_to_add;
  } else if(LTPA_dur_val == -7) {
    LTPA_miss = LTPA_miss + 1;
  } else {
    LTPA_sum = LTPA_sum;
  }
}

if(LTPA_miss == LTPA_dur.length) {
  LTPA_sum = -1;
}

LTPA_sum;

```

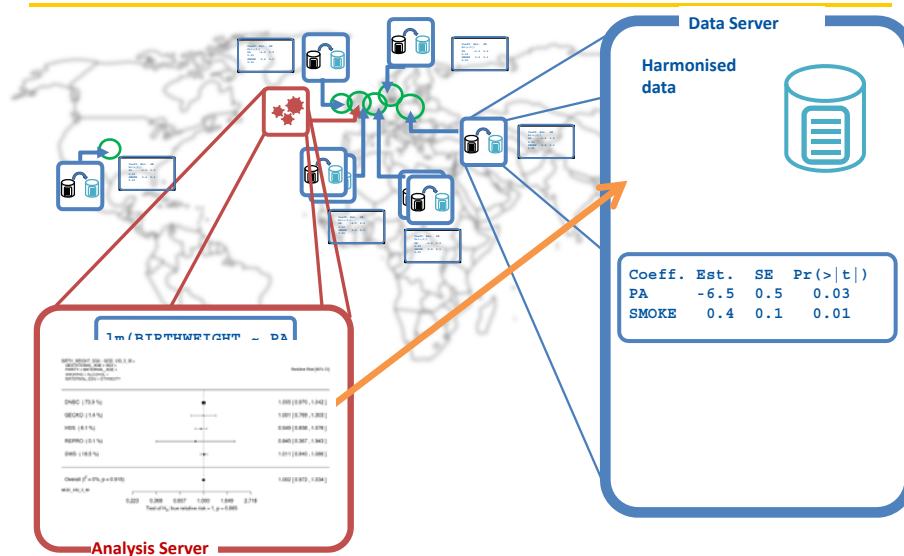

Harmonisation example: Duration of moderate-vigorous leisure time physical activity

ABCD:

*MET = Metabolic Equivalent of Task

Question in questionnaire	<p>In your spare time did you:</p> <ol style="list-style-type: none"> 1. Did you take walks for fun in the past week? 2. Did you ride a bicycle in the past week? 3. Did you play sports in the past week? (for example: tennis, handball, gymnastics, fitness, skating, and swimming) <p>For each question: At what PACE do you usually do this?</p> <ul style="list-style-type: none"> • relaxed pace • average pace • brisk pace <p>For each question: FOR HOW LONG do you usually do this?</p>
Frequency/duration	Continuous value (mins/week)
Harmonised variable	Duration of moderate/vigorous exercise (h/w)
Harmonisation rule	<ol style="list-style-type: none"> 1. Using Q1-3, sum up mins/w for all activities over 3 MET* (i.e. exclude relaxed walking) 2. Convert to hours (divide by 60)
Missing data rule	<p>Count single missing activity durations as 0 duration.</p> <p>If pace is missing, assume relaxed.</p> <p>If all activity durations missing, then mark participant as missing.</p>

How is an analysis run using InterConnect?

Association between 3rd trimester physical activity and birthweight

BIRTH_WEIGHT ~ MOD_VIG_3_fit +
GESTATIONAL_AGE + SEX +
PARITY + MATERNAL_AGE +
SMOKING + ALCOHOL +
MATERNAL_EDU + ETHNICITY

g per (hour PA per week) [95%CI]

Confirming that physical activity does not result in babies that are small for gestational age

BIRTH_WEIGHT_SGA ~ MOD_VIG_3_fit +
GESTATIONAL_AGE + SEX +
PARITY + MATERNAL_AGE +
SMOKING + ALCOHOL +
MATERNAL_EDU + ETHNICITY

Relative Risk [95% CI]

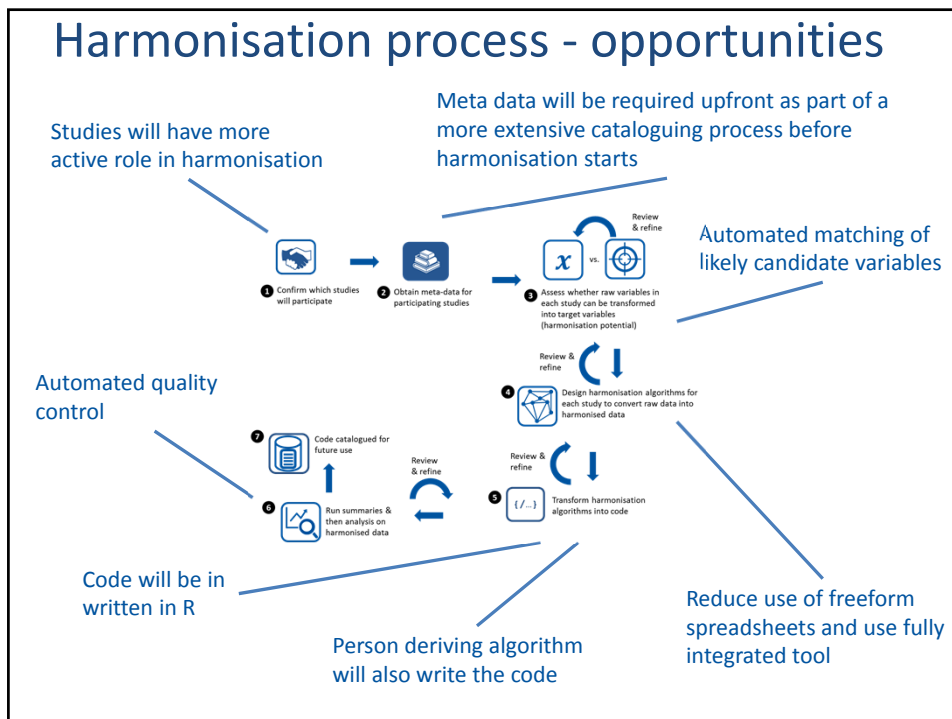

InterConnect - current status

- 18 servers set up
- 28 studies participating
- 1 publication, 2 papers in preparation, 2 analyses in progress
- Not just physical activity – diet, diabetes etc.

The future – EUCAN-Connect (Horizon 2020)

- €6M over 5 years
- Consortium of 13 institutions
- **EUCAN** – collaboration between EU and CANada
- **Connect** - Enable reuse of existing data sets to enable personalised medicine approaches

InterConnect - summary

- InterConnect dynamically takes analysis to the data (federated analysis) to reuse existing data
- We harmonised data across studies collaboratively without having access to the individual level values to obtain results for publication
- EUCAN-Connect gives opportunities to continue and extend this work
